Problem:

When I run a queue job in debug mode using the nominet module I'm getting this error:
pgp: protection algorithm 1 (IDEA) is not supported

Resolution:

Key is generated with an old pgp version, to solve this either install the idea plugin (some countries might be a problem regards the use! of the idea plugin)
or get the latest Windows version of PGP and generate a new key.

Note: NOT all freeware versions of pgp/pgp will give you the option to generate a new key with only your Nominet TAG, almost all programs will ask you for an email address, this will NOT be accepted by Nominet, you MUST generate a key without emailaddress.

Be sure you generate with SHA1 and at least 1024.
